

Progress after Upgrading

Reviewed the codes (STAN code and the R codes) for possible bugs.

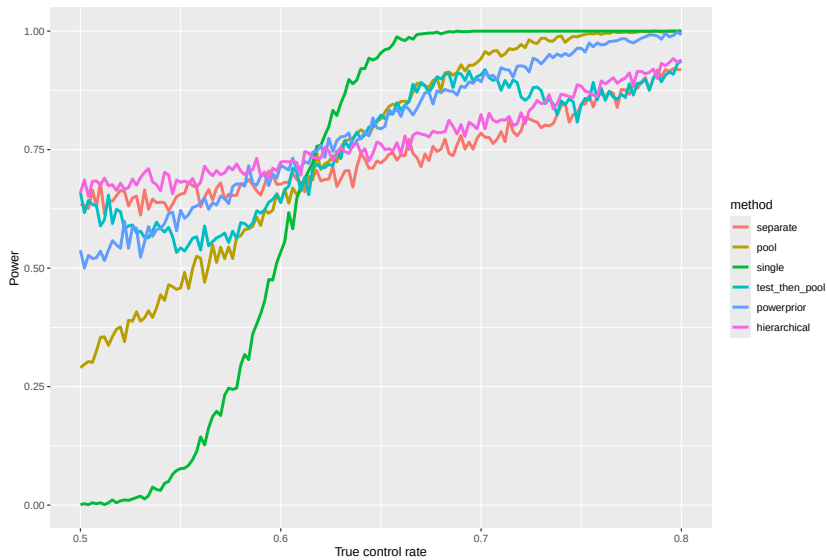

Replicated the Viele et al. (2013)

This was suggested by an assessor on the upgrading day to validate the methodology proposed during the upgrading.

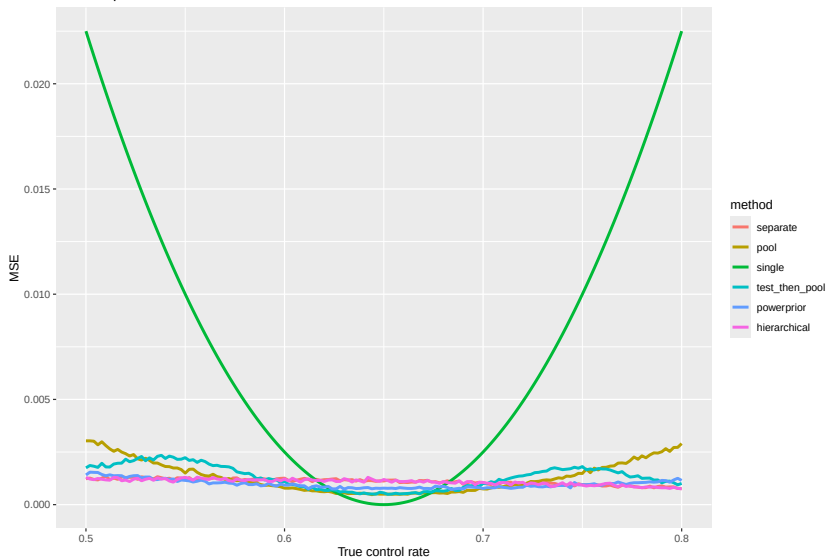

Type I error across control rates

Power across control rates

Mean Square Error of Control Estimate

Explored the MAP and RMAP methodologies.

The possibilities of borrowing on both the intercept and the prognostic scores using the MAP and RMAP.

Options for future works

Some further questions of interest are:

- ▶ Do borrowing depend on covariates as well as the outcomes?
- ▶ Can the accuracy of different PS models (e.g. hierarchical for multiple historical studies) influence the Operating Characteristic properties of the model?
- ▶ Is model mis-specification an issue for small trial?
